

Used Forklift Parts

Used Forklift Parts - Eventually, forklift components will wear and must be replaced. Acquiring brand new components can become a costly undertaking so another idea is to acquire used forklift parts. This can save a lot of money in the long run. It is a good idea to acquire used forklift components which have been reproduced. These parts would guarantee that you are getting components that will work for a long time and be productive.

Worn or broken parts that are remanufactured are a very cost effective solution than rebuilding. With rebuilding parts, only the components that are broken or worn out get replaced, which means that other wearable components may break down soon after acquisition.

Remanufactured parts are cleaned after being taken apart and have the unusable components replaced. This method could provide the best guarantee for used components. All wearable components are replaced regardless of age or wear which is one more reason why remanufactured parts overall function so much better. Any component within the part is new and this offers far longer life to the used part. Based on the lift truck components that are being redone, the cleaning process and the complete remanufacturing process would vary.

The engines are cleaned after a complete disassembly. Several engine components such as spark plugs, pistons, rings, valves, valve springs, and filters can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to guarantee that there are no noise, no oil pressure problems, no leaks or any vacuum.

Transmissions are one more item that is oven cleaned after being disassembled. The transmission is then pressure washed. A thorough inspection is done so as to check for any cracks. Bearings, bushings and seals are all replaced. Usually, the replacement parts used on transmission components meet OEM specifications.

A few parts such as torque converters, the alternator, the water pump, steer axles and the starter could get longer serviceability after being reproduced and having all wearable components replaced. The electronic control in the electric forklift is maintained by the control card. This card could also be reproduced with replacing all aged and worn out parts. Not like several forklift parts the control card can only have the worn and aged components replaced.

Remanufactured components are thoroughly inspected upon reassembly to ensure they are in top condition prior to being sold. It is essential when buying remanufactured components to be sure they have undergone the proper testing and inspection procedures. On certain larger parts like transmissions, steer axles and engines, OEM specification replacement components should be used.

The forklift dealer could ensure that the components they have reproduced meet the OEM specifications. This would also ensure the parts meet industry standards. A lot of details go into remanufacturing used components. This attention to detail offers more serviceability out of reproduced parts opposed to the components that were simply rebuilt.
