

Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that allows the individual driving to be able to control the forklift without leaving the seat. They are constructed out of top quality materials and are intended to endure the most difficult operations and work environments. Side shifting units have the extra ability to be able to laterally position the entire load or the arms in order to facilitate much more exact carrying and placement in a faster and much more effective method.

The fork pocket is somewhat unique and can enable the operator to securely swing the forks into position without any fear of damaging the positioning cylinders. This allows the driver the alternative to execute simultaneous or independent fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages can be transformed into fork positioners on available units.
